**Abstract:** A method and apparatus are provided for remotely monitoring the functioning of software processes (66) in a network connected device. The device hosting the processes is provided with a web server (60) and a library (64) of stored data-gathering or debugging functions. Each of the stored functions (64) is assigned to a particular process or group of processes (66), and each has a respective name stored in a table (62) of functions linked with the server (60). On detecting receipt of a message from a remote user including the identifying name of a stored function, the web server (60) causes that function to be applied to the associated process, obtains the data gathered by the function, and passes the gathered data to the remote user. User-defined control functions to restrict access to the process data may be supported.
